

Sprint 2: Flu Vaccination Predictor Project

By ALPHA GROUP

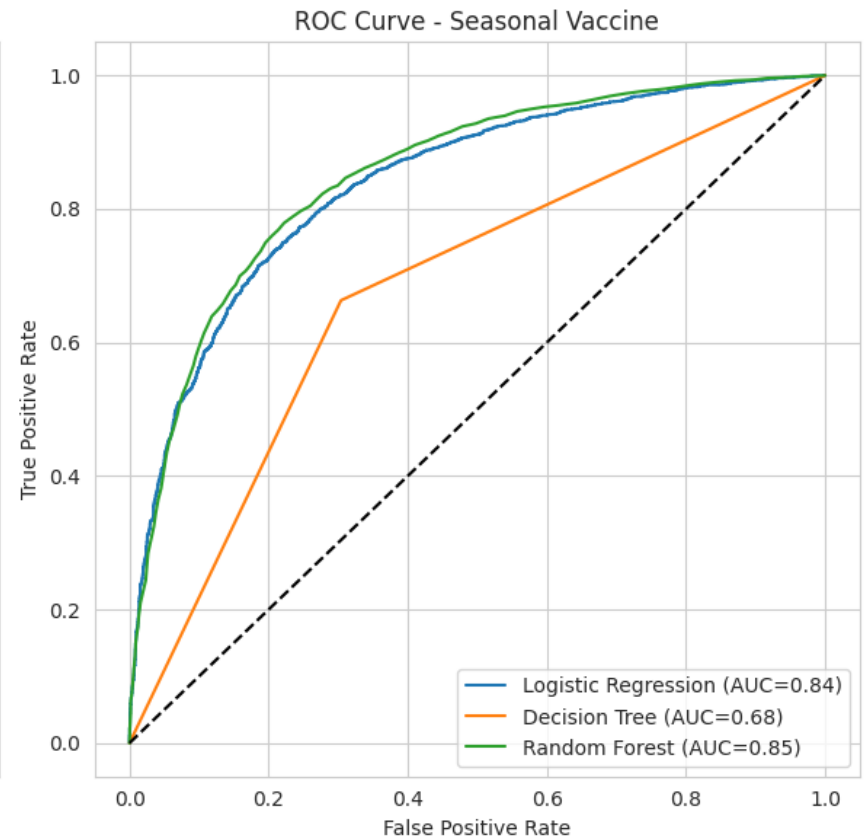

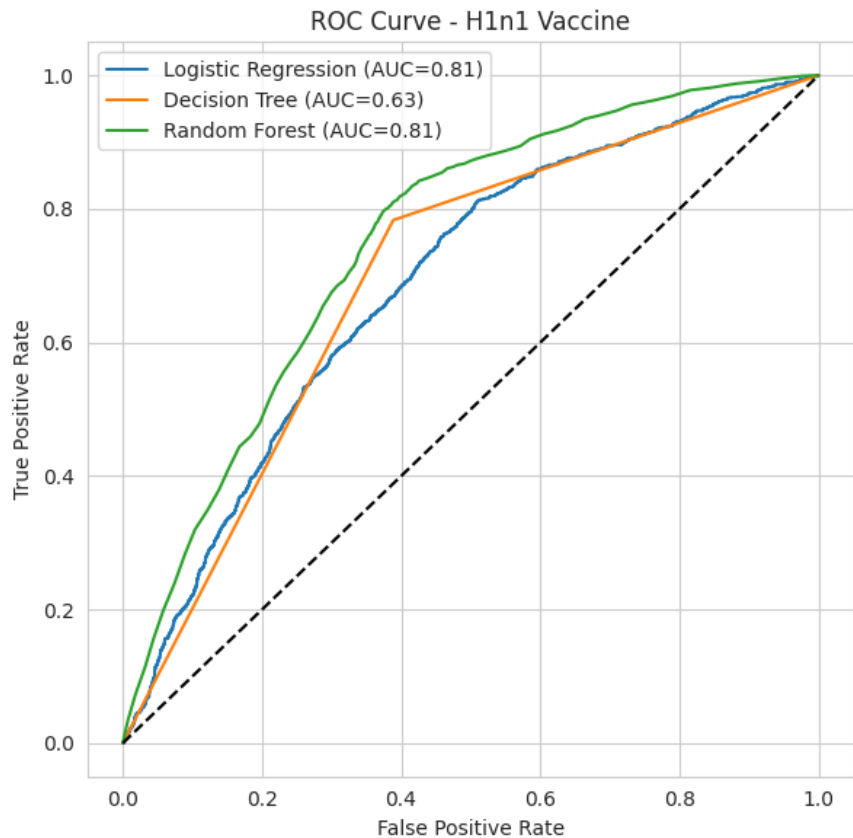

Assimagbe Albert Raphael & Saad Ali

 Based on CDC H1N1 2009 Survey Data

Project Overview

- **Goal:** Predict flu vaccination using CDC survey data (26,707 records)
- **Data Types:** Behavior, demographics, health beliefs, and access to care
- **Main Objectives:**
 - Identify factors affecting vaccine uptake
 - Build machine learning models
 - Recommend actions for public health

Baseline Model Performance Comparison

The Model Comparator For H1N1 and Seasonal Results

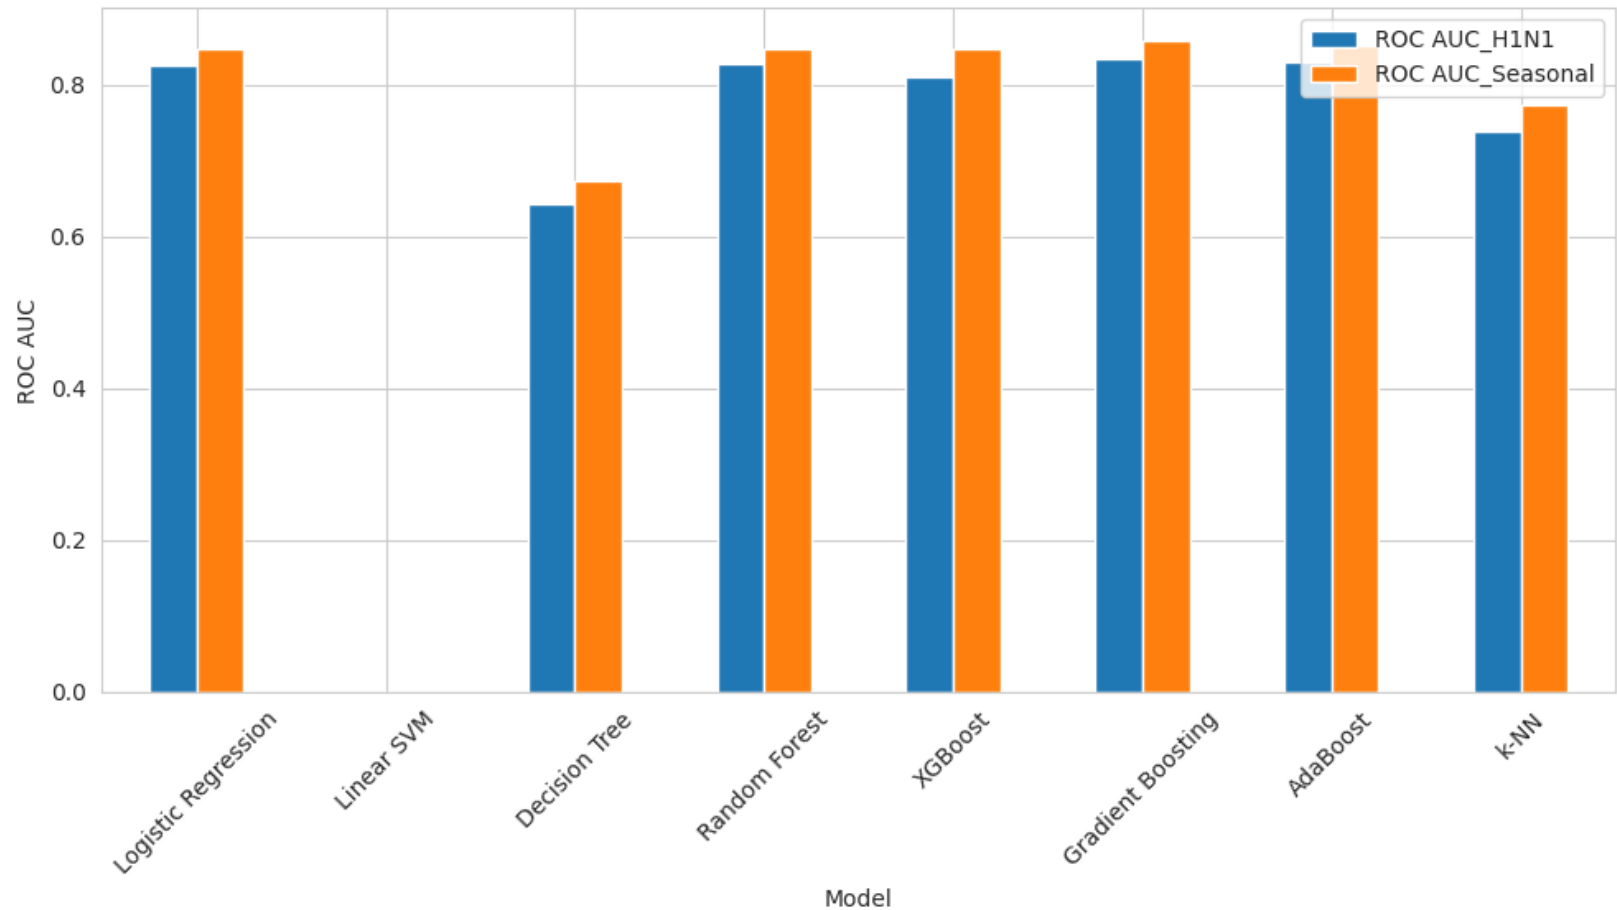

H1N1 Model Results:

	Model	Train Time (s)	Accuracy	Precision	Recall
	Gradient Boosting	3.079693	0.844440	0.713267	0.442478
	AdaBoost	0.688369	0.839573	0.703428	0.417699
	Random Forest	2.312499	0.839199	0.703148	0.415044
	Logistic Regression	0.100264	0.839760	0.703264	0.419469
	XGBoost	0.340557	0.831149	0.639364	0.462832
	k-NN	0.003762	0.813553	0.597668	0.362832
	Decision Tree	0.137255	0.754773	0.426350	0.461062
	Linear SVM	0.190614	0.831524	0.643750	0.455752

Seasonal Model Results:

	Model	Train Time (s)	Accuracy	Precision	Recall
	Gradient Boosting	3.084647	0.787158	0.773750	0.757650
	AdaBoost	0.674140	0.783227	0.777349	0.739290
	Random Forest	2.245748	0.781542	0.770430	0.746226
	Logistic Regression	0.156420	0.781355	0.773095	0.740922
	XGBoost	0.277709	0.778547	0.763071	0.750306
	k-NN	0.002722	0.718458	0.698532	0.679723
	Decision Tree	0.145816	0.676713	0.646677	0.651163
	Linear SVM	0.282451	0.773680	0.773087	0.717258

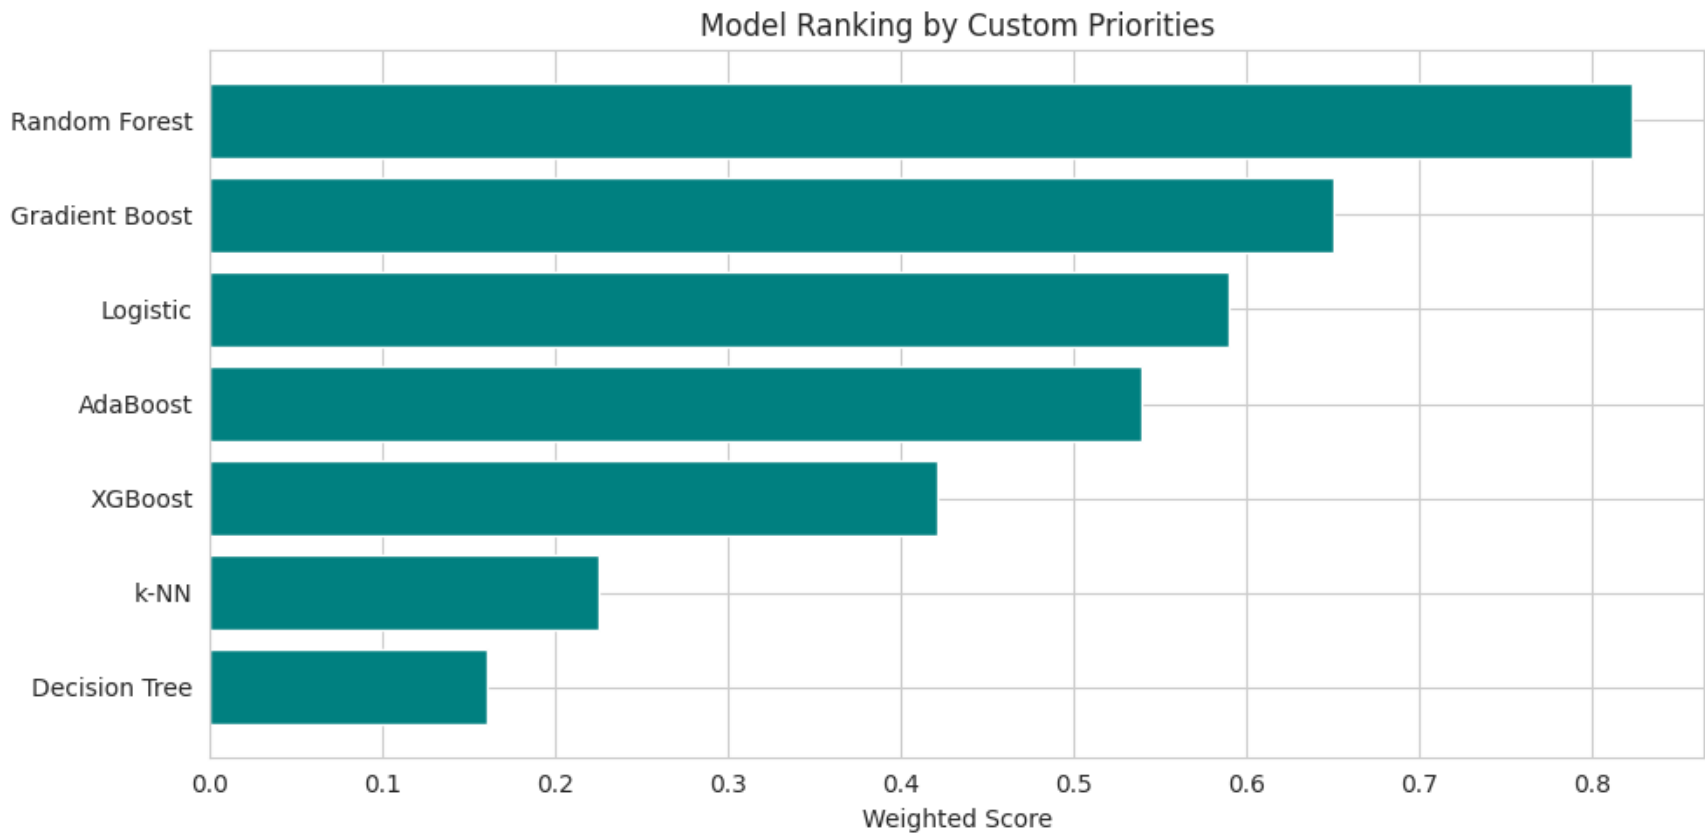

Model Performance Comparison Between Targets

Strengths & Weaknesses Of Models

Model	Strength	Weakness
Random Forest	High AUC, good overall balance	Higher memory usage
Gradient Boost	High performance and F1 score	Longer training time
Logistic	Very interpretable, fast, low memory	Slightly low recall and AUC

Best Models by Priority

Model Selection Guide

- Use Random Forest for real-world balance
- Use Gradient Boosting when accuracy is priority
- Use Logistic Regression when interpretability matters

Public Health Recommendations

- Partner with doctors to drive vaccination
- Target messaging to older and low-income groups
- Use health workers as role models
- Address safety concerns with simple language

Conclusion

- Doctor recommendation and vaccine belief are key drivers
- Gradient Boosting and Random Forest are top models
- Model insights can guide smarter public health actions
- Future work will focus on visualization and deployment
